HEALTHCARE REVENUE CYCLE ANALYTICS · REPORTING AUTOMATION

Tampa, FL · 772.486.6481 · dpatterson6575@gmail.com · [LinkedIn](#) · [Portfolio](#) · [GitHub](#)

Business Process Analyst working in healthcare revenue cycle. I build reporting systems that find money the organization was not catching and then keep running on their own. Fourteen automated reports are in service across write-off automation, worklist generation, executive dashboards and internal controls, seven of them unattended. The work has traced close to a billion dollars in annual Medicare deposits through to posting, identified over \$1M in recoverable write-off value and eight figures in duplicate payments. Currently pursuing an M.S. in Analytics at Georgia Tech.

TECHNICAL

R (tidyverse, RMarkdown, flexdashboard, arrow, openxlsx) · Python · SQL · DuckDB · Parquet · Excel/VBA · Git · Scheduled automation · Healthcare revenue cycle: aged trial balance, 835 remittance, contract grids, adjustment code logic, Medicaid and Medicare payer rules

EXPERIENCE

Encompass Health · Business Services Office

Land O'Lakes, FL · Aug 2024 – Present

Business Process Analyst III

Jul 2026 – Present

- Built a **Medicare cash reconciliation platform** that traces bank deposits through to AR posting. It covered more than 8,000 deposits representing close to a billion dollars annually, matched 98.5% of them and 99.5% of the dollars, and confirmed 5,400 or more to the penny. The median deposit posts the same day it arrives.
- Found a **multi-million dollar population of deposits that never reached AR**, and narrowed it to 113 genuine exceptions. Added a check that flags any payer and date where the match rate falls below 75% and drops more than 20 points under that payer's normal level, which is what a broken auto-posting feed looks like before anyone notices it.
- Wrote a **null-safe comparison to replace the base operator**, which had been quietly treating deposits with no reference at all as matched. Kept amount agreement out of the matching logic entirely and used it as a separate test, so the validation stays independent of the thing it is validating.
- Built a **bad debt reporting framework** that sorts every write-off dollar by adjustment code into preventable, unpreventable and needs review, replacing a single headline number with root cause. It surfaced a coordination of benefits pattern that led to front-end workflow changes, and was chosen as the basis for a wider enterprise bad debt initiative.
- Scaled that from one facility to the **whole Business Services Organization**, holding the categorization and sign convention identical so the two views reconcile against each other. Delivered ahead of deadline to Controller, Regional VP and SVP audiences.
- Deployed three Medicaid and Medicare write-off automations that **only send a file when they find something**, so a clean run is silent rather than an empty spreadsheet in someone's inbox. A Medicare Advantage build returned five figures across eleven accounts on its first run, and a state-specific Medicaid build identified a comparable amount. A third came back empty and I automated it anyway, so a known contracting exception stays covered at no ongoing cost.
- Wrote the **documentation standard for the reporting portfolio**: fourteen sheets covering why each report exists, the logic in the order it runs, where the data comes from and what the known limits are. Any number in it can be defended without opening the code.

Business Process Analyst II

Dec 2025 – Jul 2026

- **Automated Medicaid due diligence** across five data sources, proving account by account that the primary payer had already exceeded the contract rate in effect during the stay. Identified **over \$650,000 across more than 150 accounts**. Still running today as a weekly control.
- Pointed the same framework at **BCBS secondary accounts** and recovered **roughly two thirds of the Medicaid result**, in a much shorter build because the method was already proven. Together the two reports account for **more than \$1M in write-off value** the organization was not identifying before. Caught a data problem during validation where financial class was changing before payments posted, and corrected the population before release.

- Rebuilt the duplicate payment review as a **DuckDB-backed analytics platform** with full history retained. It has since surfaced eight figures in duplicate payments, with insight into payers, day of week, calendar concentration and facility. It reads the team's existing output, so nobody had to change how they work.
- Built the **AR Underperformers Report Card** on pacing rather than a flat target, measuring each facility against 98% of business days elapsed. A facility behind in week two is not the same problem as one behind in week eleven. Leadership sees the gap in dollars rather than percentages.
- Rebuilt it for production by trimming what gets loaded and imported, **without touching a single metric definition**, then parameterized it into per-team report cards across every operating team.
- Automated a **daily reconciliation of refund records against the vendor master of record**. Rebuilt the match to key on vendor ID with address as an exception flag rather than the other way round, and sorted the output so reviewers only look at what needs attention.
- Delivered the first HTML Medicaid performance report and a full credit balance operational reporting suite for executive leadership, establishing the format and financial class segmentation later reused across the portfolio.

Accounts Receivable Analyst III

May 2025 – Dec 2025

- Identified **seven figures in overpayments at roughly 99% accuracy** through account level review of posting activity, which became the analytical basis for the duplicate payment reporting built the following year.
- Drove a **60% month over month reduction in duplicate payments** by isolating the posting behaviours causing them and feeding those findings back into daily review.

Accounting Assistant

Aug 2024 – May 2025

- Supported revenue cycle posting and reconciliation while building the early reporting automations that led to promotion into the analyst track.

The BA Fund · Commercial Loan Broker

Aug 2017 – May 2025

- Owned the full origination process at a family commercial lending business, from borrower intake and financial package assembly through lender matching, underwriting coordination and close.

EDUCATION

M.S. Analytics, Computational Data Analytics · Georgia Institute of Technology

Expected Dec 2028

B.A. Economics and Econometrics · University of South Florida

Dec 2024

Google Data Analytics Professional Certificate

Jun 2025

SELECTED INDEPENDENT PROJECTS

- **Medicare Payment Variability and Revenue Leakage Detection Model.** Claims-based analysis of payment variability across 2,845 providers, segmenting recovery opportunity by DRG and identifying where charges and payments decouple.
- **U.S. Healthcare Cost and Payments Dashboard.** National spending, payer flow and operational efficiency analysis built on CMS National Health Expenditure data.

Employment results are stated as scale and ratio rather than exact internal amounts. Specifics available in interview context.
